

# Loquelic Iteritas Percido Patchbook

Some basic patches and ideas to try with your LIP. Just set the knobs to match the pictures and you're off! Once you've tried out some of these sounds, create your own patches and document them with the blank patch sheet on the last page.

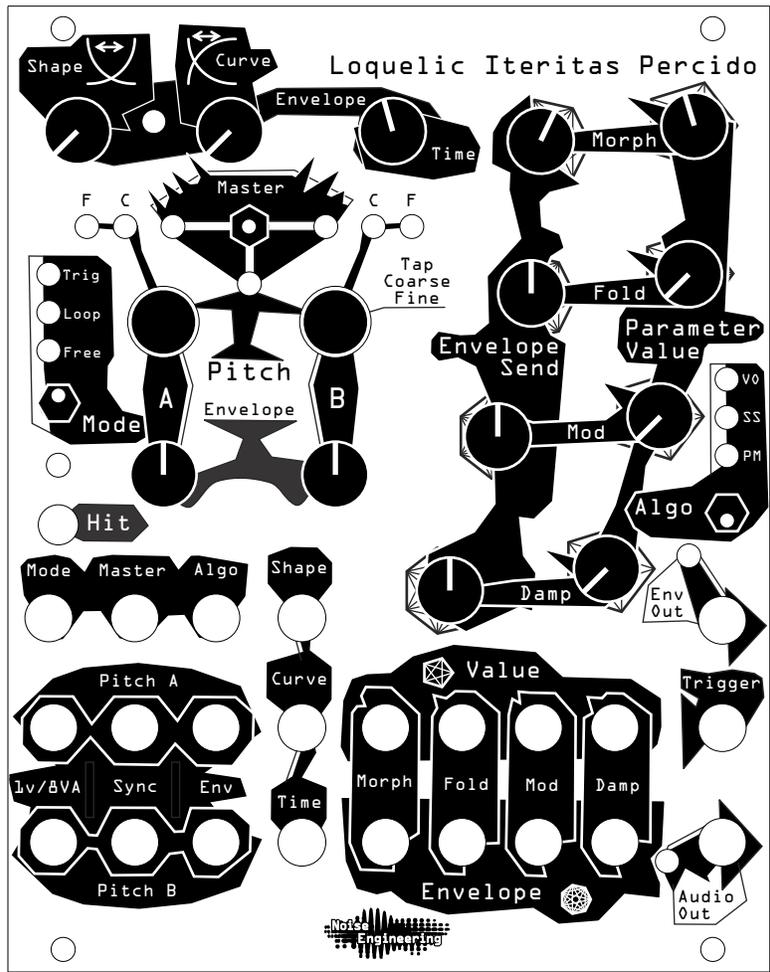

## Kick

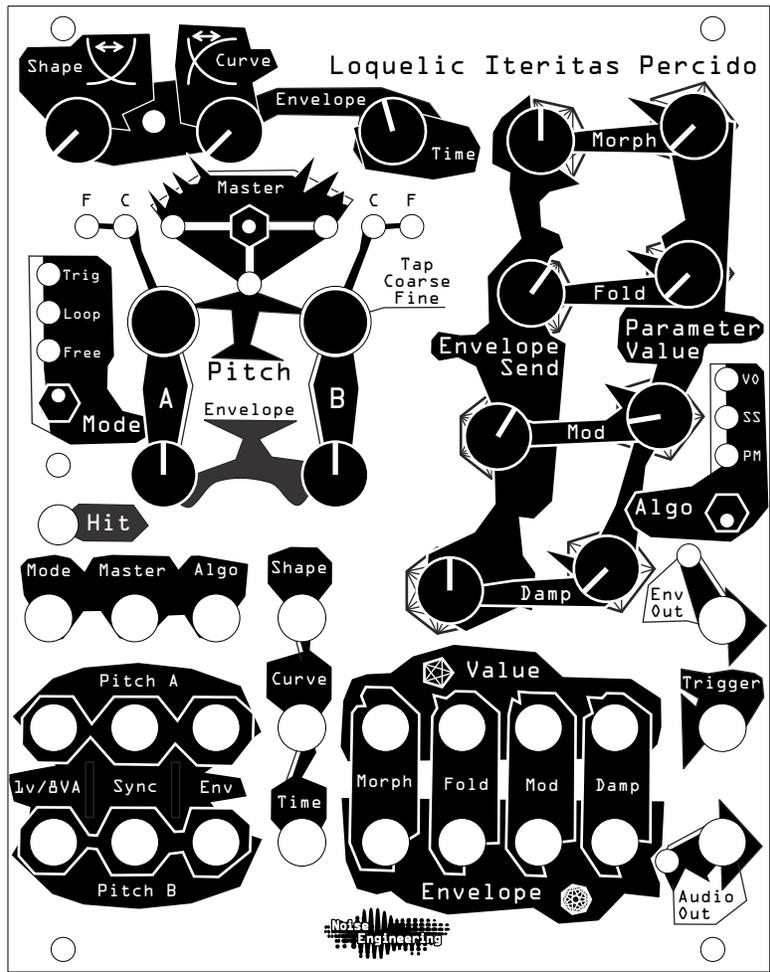

It's a kick drum!

Patch a trigger to Trigger. Tune oscillator A to the rest of your patch. Add some Morph, Fold, and Mod to get things more ridiculous.

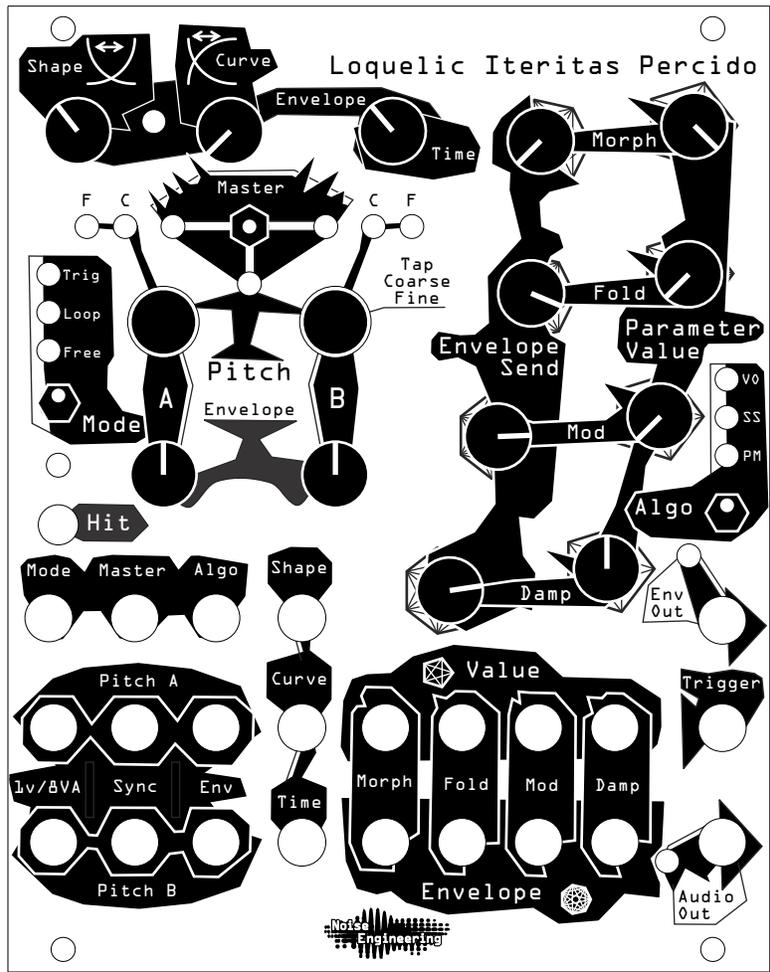

## Sounds Subtractive

Emulating a saw wave into a LPF.  
 Patch a trigger into Trigger, and a pitch CV  
 sequence into Pitch A's lv/BVA jack. Tune  
 oscillator A down low for some bassy fun!

### PM pluck

Bassy, plucky, fun!  
 Tune oscillator B up one octave from oscillator A.  
 Hint: to hear the pitch of each oscillator, set the Master switch to the oscillator you want to tune. In this case, set Master to A, tune to taste, then switch to B and tune one octave up from A. Patch a trig to Trigger, a pitch CV sequence to Pitch A's lv/ΔVA jack and you're off!

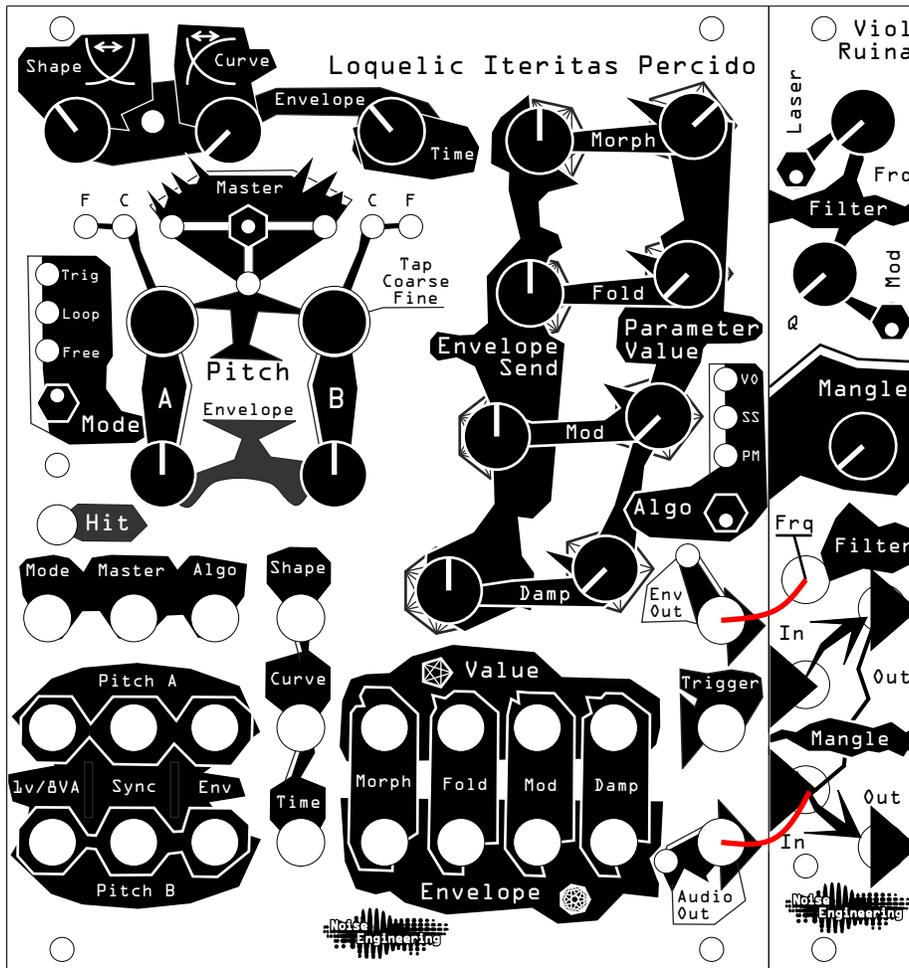

## Roar

Whoa!

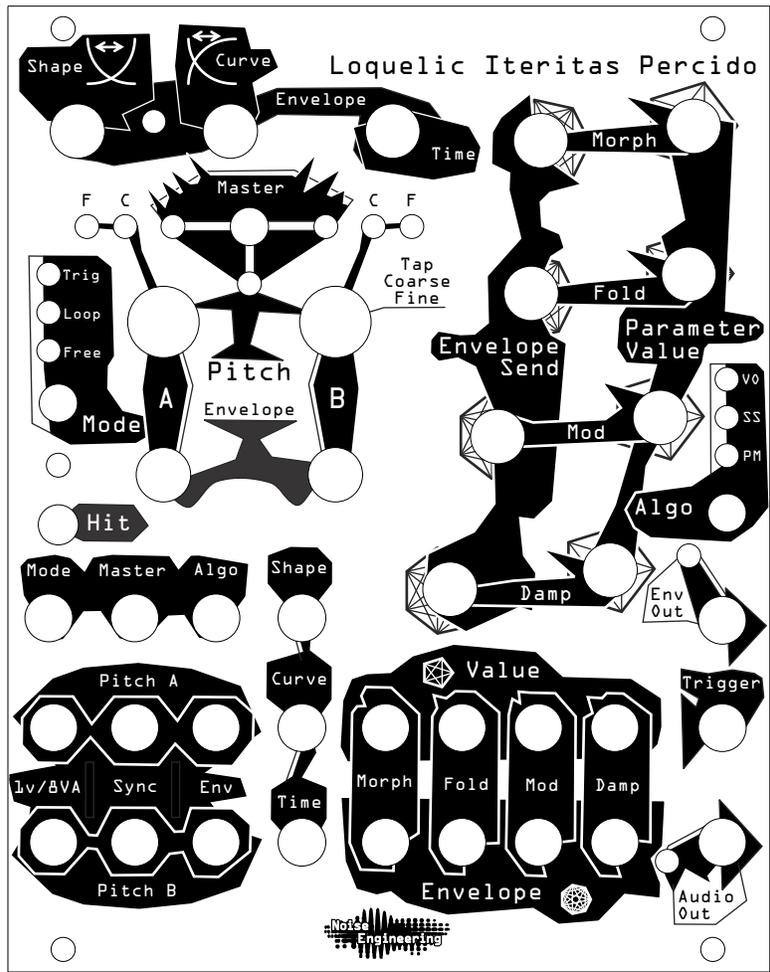

Tune oscillator B up two octaves from oscillator A, using the technique from the previous patch. Set knobs to match the picture, then send in a trigger to Trigger!

Try it out in SS mode too for some even crazier sounds.

## Actual Subtractive

Run the Env Out to a filter like Viol Ruina's CV input and run LIP through the filter to create a compact subtractive voice.
